Loot the dungeon to loot the vault

Game Genre and Style

- **Genre:** stealth, looter, dungeon crawler
- **Play Style:** 3D first-person
- **Visual Style:** Low-Poly, 3D Stylized Art

Game Goal and Win/Loss Conditions

- **Primary Goal:** Improve your character by acquiring blessings, offerings, and map knowledge to complete the story ending and survive.

Win Conditions:

(Raid to raid): Extract from the chambers with your acquired loot

(Story): Extract from the chambers after acquiring the Final Offering.

Lose Conditions:

The player is caught by cultists and sacrificed to lord Xenu.

Failure to avoid environmental hazards.

Core Mechanics and Rules (“Toolbox”)

Main Player Abilities:

- Walking:
 - The W, A, S, and D keys will be used to move the player around.
- Sprinting:
 - Pressing and holding the shift key will increase players' move speed along the local Z axis.
- Sneak:
 - Pressing and holding the left control key will decrease the player's move speed and reposition the main camera to a lower position.
- Jump:
 - Pressing the space bar will cause the player to jump. Including jumping will enable us to introduce hazardous terrain and parkour-based puzzles.
- Level Interactions:
 - When the player reaches a zone they can interact with, pressing either the F or E key will trigger an output event.
- Upgrade system (Blessings):
 - The player can find blessings while in the dungeon. One blessing's location will be marked per run. Blessings will adjust values in the player and chamber manager scripts to boost player stats. Before entering the chambers, the player will select three blessings to use for their upcoming run.
- Sonar Ping (Finite):
 - The player will be able to press the Q key to activate their sonar ping three times per run. When the ability activates, any cultists within a detection sphere trigger collider will output a low-volume sound effect.

Core Systems:

- Stealth Systems:
 - Stealth System 1: “Sound” Detection
 - Child to the Player game object is an empty transform with a trigger sphere collider attached to it. Initially, the radius of this zero is units. The radius of the detection sphere collider scales with how fast the player is currently moving. The player manager script takes the speed the player is moving and multiplies it by an integer value called Detection Trigger

Multiplier; the product is the radius of the detection sphere. When an enemy enters a collision with the detection sphere, their pathfinding state will be set to Investigate mode. The Detection Trigger Multiplier will increase the longer the player remains in the chambers.

- Stealth System 2: Visual Detection
 - Each enemy prefab will have a camera component attached to it. The camera is constantly checking to see if the player game object is in view of the detection camera. While the AI is in Idle state, the detection camera oscillates along the Y axis to increase the enemy's field of detection. When the detection camera detects the player, the AI state is set to pursuit.
- CLANK System:
 - CLANK is how we increase the difficulty during a run. The system is essentially a stopwatch system that activates in-game events when time criteria have been met. The CLANK events that get fired will increase difficulty by adjusting multipliers and values in the player and enemy managers. The player also accrues CLANK when they move around the level too fast. If a player sets off too many triggers within a period of time, the script will add to the current CLANK timer value to increase the amount of time the player has been in a run.
- Offering Tasks:
 - Every time the player picks up an offering, their CLANK level will be increased. Forcing the player to perform an action that is detrimental to their raid survivability will strongly reinforce our emphasis on risk-reward gameplay. The difficulty spike also serves as a quasi-boss battle.
- The Final Offering:
 - After opening the door and picking up the final offering, the player's CLANK Level will be set to a special state. When this special CLANK state activates, two cultists will be spawned at the main entrance, and all enemies in the chambers become alerted to the player's presence
- Exit points:
 - When the player wishes to exit the chambers with their acquired loot, they must locate an exit.
 - Main- will always be on the map and marked on the compass
 - Hidden: Scattered across the edges of the map are unmarked exits. These exits are not marked on the player's compass and require the user to discover them while in the chambers. Hidden exits are persistent and always available so long as the player remembers how to solve the activation puzzle and where it is located.

Game Rules:

- A sacrificial altar located in a central location of the chambers requires four offerings to complete a ritual. The four offerings are hidden around the entire map. The player will collect these four keys by interacting with them as they encounter them. Once the player has collected all four offerings, the ritual can be completed, and the player gains access to the final offering.
- In raid scales with time spent in a raid.
- One map with persistent exits.
- If the player is caught by an enemy, the player's progress from the run is lost, including any loot they found but did not escape with.
- The player collects Blessings while in the tomb. Before the start of a raid, players can choose Blessings to increase their survivability in the upcoming raid.
- Hidden entities can be triggered by interacting directly with them or completing their puzzle.
- Triggering too many CLANK triggers can result in a difficulty increase.

Play Psychology

Player Motivation:

The Player feels tense while also excited when going into the game. Part of the game is to go and grab items so that the player can be stronger, but as the player engages with the game more and gets better, they will naturally start to become more bold with their actions, and that adds more reward with another layer of risk, which feels exciting

Engagement Methods:

Our game is segmented into multiple runs. This encourages replayability because the player will continue to do more and more runs until they stockpile enough items to make the final run to find the last item.

The player is kept engaged through a consistent buildup and release of tension by delving through the tomb and narrowly avoiding cultists.

Difficulty and Reward Balance:

The player getting the offerings allows them to progress through the game towards the end but at the beginning, without any blessings, that is extremely difficult to do. Failure isn't permanent but the items that you have on you during the raid will be lost. The reward is both short term and long term in the sense that the blessings are

the short term reward while the long term reward is the offerings needed to open the door to get the final item of the game

Story Overview

Setting:

The game takes place in a dungeon where they must sneak their way through while avoiding cultists to settle their accrued debts by breaking into the center and taking its most valuable artifacts.

Plot Summary:

The player character is a grave robber in desperate need of money, who comes to a tomb to rob it. A helpful denison leading the player to dangerous raids in the tomb until the player reaches the center. This will be the climax where the player is hunted by the helper as they make their final escape.

Main Characters:

- Knell, assistant of the cult who leads people to their deaths for them. , Tutorial and antagonist,
- **GraveRobber:** A desperate soul down on his luck given one last opportunity to settle their debts, Protagonist, cowardly and greedy.

Player's Journey:

The player progresses through the story by accruing relics in the tomb, then getting each of the fore keys. The story finishes by the player acquiring and escaping with the final relic that is held in the center locked door.

Game Aesthetics

Art Direction:

- The game will have dark elements like an overgrown dungeon, a gloomy environment, and old items. The character(s) are going to be in chibi art style.

Art Creation Plan:

- The models will be created using Maya and Blender. We will also use Substance Painter and Ambient Cg for textures, and Procreate for the concept art.
- We're planning to design differently styled levels as it gets more complicated. We will create secret rooms and several types of enemies that are different colors from each other

Music & Sound:

Sound

- **Sound is going to have horror game aspects, such as stingers as you get caught and whispers as the enemies are roaming around the environment. Other sounds will come from picking up any items and the UI but many of the sounds will be natural in sound. It makes the game more grounded. There will also be sound cues for the player making noise**

Music

- **The music will be inspired by stealth games such as Thief and Dishonored. It will be more ambient but change as you are in the dungeon longer. It will turn from a calm but tense sound into a tense more jumpy track. Then there will be a chase theme as well for when the enemies chase the player. These will flow into each other well. The "safe" room will also have a theme where they have a calm safe feeling.**

Concept Art

- **Concept Art 1**

- **Concept Art 2**
